5. Diagram

Tie one end of the string to the metal ball and the other end through the centre/hole of the protractor.

When the train is at rest, held fixed the protractor in the plane along the direction of motion such that the string is on, say, the 90° mark.

When the train is accelerating with acceleration a , the string will make an angle, say θ , with the vertical. Measure the angle θ .

Let T be the tension of the string,

Vertically : $T \cos \theta = mg$ ①

Horizontally : $T \sin \theta = ma$ ②

where m is the mass of the ball
