Note: Figures in brackets indicate the percentages of candidates choosing the correct answers.

Paper 1 Section B

Solution		Marks	Remarks
1.	(a) (i) $(1.5)(4200)(60 - 10) = m(3.34 \times 10^5) + m(4200)(10 - 0)$ $m = 0.837766 \text{ kg} \approx 0.838 \text{ kg}$	1M+1M 1A	
		3	
	(ii) More ice is needed to cool the container as it will release heat / thermal energy as well.	1A 1A	
		2	
	(b) (i) Conduction: - Foam is a poor conductor (of thermal energy) and it minimizes the transfer of heat / thermal energy from the surroundings to the cool contents / ice cream (inside the bag). OR Radiation: - The shiny surface (inside) reduces the transfer of heat / thermal energy from the surroundings to the cool contents / ice cream (inside the bag) through emission of radiation OR Convection: - The zipper prevents convection between the hot air outside and the cool contents / ice cream (inside the bag).	1A Any ONE	
		1	
	(ii) (Radiation) Make the outer surface (of the bag) shiny.	1A	
		1	
	2. (a) $pV = nRT$ $(100 \times 10^3)(0.52) = n(8.31)(273+15)$ $n = 21.727504 \text{ (mol)} \approx 21.7 \text{ (mol)}$	1M 1A	
		2	
	(b) (i) Since $pV = nRT \Rightarrow V = \frac{nRT}{p}$ volume V of the balloon depends on both T and p , the (fractional) decrease in pressure p (with height) is greater / faster than the (fractional) decrease in temperature T .	1A 1A	Accept: (21.0 ~ 22.0) mol Accept: volume V decreases as temperature T decreases would be true only if pressure p is constant, however, p decreases with height.
		2	
	(ii) (1) $\frac{pV}{T} = \text{constant}$ $\frac{(100)(0.52)}{(273 + 15)} = \frac{p(8)}{216}$ $p = 4.875 \text{ kPa or } 4875 \text{ Pa}$	1M 1A	
		2	
	(2) $p = p_0 e^{-kx}$ $4.875 = 100 e^{-0.138x}$ $x = 21.89166726 \text{ (km)} \approx 21.9 \text{ (km)}$	1M 1A	
		2	

Solution	Marks	Remarks
3. (a) (i) (1) $\frac{1}{2}mv^2 = mgh$ $v^2 = 2(9.81)(12)$ $v = 15.344054 \text{ m s}^{-1} \approx 15.3 \text{ m s}^{-1}$ $(v = 15.491933 \text{ m s}^{-1} \approx 15.5 \text{ m s}^{-1} \text{ for } g = 10 \text{ m s}^{-2})$ (2) $s = \frac{1}{2}gt^2$ $12 = \frac{1}{2}(9.81)t^2$ $t = 1.564124 \text{ s} \approx 1.56 \text{ s}$ $(t = 1.5491933 \text{ s} \approx 1.55 \text{ s} \text{ for } g = 10 \text{ m s}^{-2})$ (ii) $F - mg = \frac{mv - mu}{t}$ $F = \frac{70 \times (0 - (-15.3))}{0.3} + 70 \times 9.81$ $= 4266.9793 \text{ N} \approx 4270 \text{ N}$ $(F = 4314.7845 \text{ N} \approx 4310 \text{ N} \text{ for } g = 10 \text{ m s}^{-2})$ (iii) Elastic potential energy (b) (i) (Velocity is too high, hence the force for deceleration is very large.) - The life net may be torn. - The falling person may be injured. - The firemen may not be able to hold the life net tight. } Any ONE (ii) There exists a horizontal velocity when a person jumps and the horizontal displacement is very difficult to estimate as it depends on the time of fall, which is relatively long.	1M 1A 2 1M 1A 2 1M+1M 1A 3 1A 1 1A Any ONE 1 1A 1A 2	Accept: (15.0 ~ 15.5) m s⁻¹ Accept: (1.50 ~ 1.60) s Accept: (4180 ~ 4320) N

Solution		Marks	Remarks
4. (a)	(i) Rotation rate = $\frac{\omega}{2\pi} = \frac{5.0}{2\pi}$ = 0.795775 (rev s ⁻¹) $\approx$ 0.80 (rev s ⁻¹)	1M/1A	Accept: (0.79 ~ 0.80) rev s ⁻¹
		1	
	(ii) 		
	F_C correctly indicated.	1A	
	$F_C = mr\omega^2$ = (0.03)(1 $\times$ cos 23.1°)(5.0) ² = 0.689866 N $\approx$ 0.690 N ($F_C = 0.7033402$ N $\approx$ 0.703 N for $g = 10$ m s ⁻²)	1M 1A	
	<u>OR</u> $T\cos\theta = F_C$ and $T\sin\theta = mg$ $F_C = \frac{mg}{\sin\theta} \cos\theta = 0.689866$ N $\approx$ 0.690 N	1M 1A	
		3	
	(iii) Horizontal component of tension provides the centripetal force, thus tension is larger than the centripetal force.	1M 1A	
	<u>OR</u> $T\cos\theta = F_C$ $\Rightarrow T > F_C$	1M 1A	
	<u>OR</u> $T\sin\theta = mg$ $\Rightarrow T(0.750 \text{ N}) > F_C(0.690 \text{ N})$	1M 1A	
(b)	(i) The gravitational force is always perpendicular to the moon's motion / displacement / velocity, thus no work is done on the moon by this force (k.e. unchanged)	1A 1A	Accept: action and reaction pair
		2	
	(ii) (The claim is incorrect) as, by Newton's third law of motion, gravitational force of the same magnitude (but in opposite direction) is acting on the Earth by the moon.	1A 1A	
		2	

Solution	Marks	Remarks
5. (a) (i) wavelength $\lambda = \frac{0.06}{7-1}$ $= 0.01 \text{ m } (= 1 \text{ cm})$	1A 1	
(ii) speed $v = f\lambda = 10 \times 0.01$ $= 0.1 \text{ m s}^{-1} (= 10 \text{ cm s}^{-1})$	1M/1A 1	
(b) (i) frequency = 10 Hz	1A 1	
(ii) The diagram illustrates wave refraction at a boundary between two regions. Region P is labeled 'shallow region P' and contains vertical wavefronts with a horizontal double-headed arrow indicating a wavelength of 6 cm. Region Q is labeled 'deep region Q' and is shaded grey. The boundary is a diagonal line. In region Q, the wavefronts are tilted towards the normal. Arrows show the wave direction changing at the boundary.	1A 1A 2	
(iii) Refraction. It is due to the change in wavelengths / wave speeds in different media / depths.	1A 1A 2	

Solution		Marks	Remarks			
6. (a)	L is diverging / concave.	1A				
	Only diverging / concave lens forms diminished, virtual image.	1A				
		2				
(b)						
	Correct position and height of object	<table border="1"> <tr><td>2A</td></tr> <tr><td>2</td></tr> </table>	2A	2		
2A						
2						
(c)	Correct ray to locate F and focus F correctly marked. Focal length = 16.5 cm	<table border="1"> <tr><td>2M</td></tr> <tr><td>1A</td></tr> <tr><td>3</td></tr> </table>	2M	1A	3	Accept: (15.5 ~ 17.5) cm
2M						
1A						
3						
(d)	Correct ray p from tip of object	<table border="1"> <tr><td>2A</td></tr> <tr><td>2</td></tr> </table>	2A	2		
2A						
2						

Solution	Marks	Remarks
7. (a)  Close the switch and record corresponding V and R readings Adjust the resistance R to lower/other value(s) and repeat the experiment Precaution: - First set the variable resistor to its maximum / a large value - Open the switch after each measurement - Any reasonable answer	1A 1A 1A 1A 1A 5	Correct circuit with correct symbol Correct polarity Alternative circuit 
(b) Terminal voltage V delivered increases with increasing (loading) resistance R (or graphical representation) $V = \xi \frac{R}{R+r} \quad \text{OR} \quad V = \xi - \frac{\xi}{R+r} r$	1A 1A 2	Accept: 

Solution	Marks	Remarks
8. (a) 	1A 1	
(b) (i) - If one of the lighting sets / circuits fails, the other (in parallel) can still operate, i.e. both work independently. - Both can work at the rated power. - Any reasonable answer	1A Any ONE 1	
(ii) $P = IV$ $(300 + 450) = I(220)$ $I = 3.409091 \text{ A} \approx 3.41 \text{ A}$ Thus 5 A fuse should be used.	$I = \frac{P_1}{V} + \frac{P_2}{V} = \frac{300}{220} + \frac{450}{220}$ 1M 1A 1A 3	
(c) Electrical energy used per day $= 0.500 \text{ kW} \times 8 \text{ h} + 2 \text{ kW} \times 0.5 \text{ h} + 3 \text{ kW} \times 2 \text{ h}$ $= 11 \text{ kW h}$ Cost = \$0.9 / kW h $\times$ 11 kW h $= \$9.9$	1M 1M 1A 3	

Solution		Marks	Remarks
9. (a)	(i) By Lenz's law, an e.m.f. would be induced such that it opposes the change, i.e. decrease of magnetic flux (into the paper) by driving an induced current (clockwise) in the coil / circuit (complete).	1A 1A	
		2	
	(ii) $N\Delta\Phi = NBA$ $= (20)(0.3)(0.005)$ $= 0.03 \text{ Wb}$ $\xi = \frac{N\Delta\Phi}{\Delta t} = \frac{0.03}{0.5}$ $= 0.06 \text{ V (or 60 mV)}$	1A 1M 1A	
		3	
	(b) (i) The change of (magnetic) flux linkage is double that in (a)(ii), i.e. 0.06 Wb.	1M/1A	
		1	
	(ii) Direction of current : $PQRS$	1A	
		1	
	(c) (i)		
	 The diagram shows a rectangular aluminium plate with a coil wound around it. The plate is positioned between two vertical dashed lines. To the right of the plate, there is a magnetic field represented by 'x' marks, indicating it is directed into the page. A circular arrow on the coil indicates a clockwise induced current when viewed from the right.	1A 1A	
		2	
	(ii) Move / swing to the right initially / momentarily / briefly.	1A	
		1	

Solution	Marks	Remarks
10. (a) (i) $x = 3$	1A	
	1	
(ii) More neutrons are produced in each fission for triggering further fissions, i.e. $x > 1$.	1A	
	1	
(b) (i) $m = m_0 e^{-kt}$ $k = \frac{\ln 2}{t_{1/2}} (= 9.846 \times 10^{-10} \text{ yr}^{-1})$ $0.06 = m_0 e^{-\ln 2 \times \left[\frac{2 \times 10^9}{7.04 \times 10^8} \right]}$ $m_0 = 0.429882832 \text{ (kg)} \approx 0.430 \text{ (kg)}$	1M 1A	
	2	
(ii) $\frac{0.430}{13.556 + 0.430} = 0.03073691 \approx 3.1 \% > 3\%$ Thus natural nuclear fission was possible.	1M/1A	
	1	
(c) <u>Underground water might run dry.</u>	1A	
<u>OR Energy released by fission dries up the underground water.</u>	1A	
Therefore, fission might stop without slow neutrons.	1A	
	2	

OR $0.06 = m_0 \left(\frac{1}{2}\right)^{\frac{2 \times 10^9}{7.04 \times 10^8}}$
