	(b)	(i)	Conduction: - Foam is a poor conductor (of thermal energy) and it minimizes the transfer of heat / thermal energy from the surroundings to the cool contents / ice cream (inside the bag). <u>OR</u> Radiation: - The shiny surface (inside) reduces the transfer of heat / thermal energy from the surroundings to the cool contents / ice cream (inside the bag) through emission of radiation <u>OR</u> Convection: - The zipper prevents convection between the hot air outside and the cool contents / ice cream (inside the bag).	1A	Note : Convection is the least effective transfer process in this case as the hot air outside is above the denser cool air around the ice cream.
