- (b) Temperature difference between hot water and the surroundings (room temperature) decreases as time elapses.  
Rate of energy loss / heat loss becomes smaller,  
hence rate of temperature drop is smaller and the curve becomes less steep.

- (ii) Comparing to cup  $X$  as a control,  
Cup  $Y$ :  
The shiny surface of aluminium foil is a poor emitter /  
good reflector of radiation (thus reduces heat lost to  
surroundings).  
Cup  $Z$ :  
No lid allows convection through air / surroundings.

Or  
No lid enhances heat lost by evaporation / convection /  
contacting with air / surroundings.
