5. Figure 5.1 shows a smooth sloping track  $ABC$  firmly fixed in a vertical plane with its horizontal part  $BC$  resting on a bench surface. You are given a toy skier, a metre rule and a long rough paper strip with adhesive tape on the bottom surface.

Using the apparatus provided, describe an experiment to study how the stopping distance of the toy skier depends on its height of release. Your description should include the physical quantities to be measured and the result expected. (5 marks)

- (a) Referring to the passage, explain why there should be a maximum load limit for a vehicle (see the vehicle label example below). (2 marks)

Mechanical braking is the most common braking method in vehicles. In this method, wheels of vehicles are fitted with brake pads which apply frictional forces that inhibit the motion of the wheels. Frictional braking results in a conversion of the vehicle's kinetic energy to thermal energy which then dissipates to the atmosphere in the form of waste heat.

The thermal energy (in J) generated during braking is approximately given by :

$$\text{thermal energy generated} = F_f \times d$$

where  $F_f$  is the frictional forces (in N), and  $d$  is the braking distance (in m).

Applying the principle of energy conservation :

$$\text{kinetic energy dissipated} = \text{thermal energy generated}$$

$$\frac{1}{2}mv^2 = F_f \times d$$

From this equation it can be seen that increasing the velocity  $v$  or mass  $m$  of an object means the applied frictional forces must be increased in order to bring the object to a stop within the same distance.

3. Read the following passage about braking in vehicles and answer the questions that follow.

Answers written in the margins will not be marked.

- (b) (i) It is known that the brake pads would provide much smaller frictional forces or even brake failure would occur (i.e. without any friction provided) when reaching a temperature of over a few hundred degrees Celsius. Explain why it is not recommended for a vehicle driver to **apply the brakes continuously** during a long downhill trip. (1 mark)

.....

.....

.....

- (ii) The figure shows an emergency escape ramp (slanting upwards) built for stopping vehicles with brake failure resulting from the situation described in (b)(i). If such a ramp makes an angle of  $30^\circ$  with the horizontal and a vehicle with brake failure enters the bottom end of the ramp at a speed of  $25 \text{ m s}^{-1}$ , estimate how far it will travel along the ramp before it stops. Neglect air resistance and mechanical resistances within the vehicle. ( $g = 9.81 \text{ m s}^{-2}$ ) (2 marks)

3. A volleyball player serves by hitting the ball from rest at a height of 1.0 m above the end line of the court. The initial speed of the ball is  $13.4 \text{ m s}^{-1}$  making an angle of  $55^\circ$  with the horizontal. It moves in a vertical plane perpendicular to the end line and finally reaches point C on the opposite end line as shown in Figure 3.1. Neglect the size of the ball and air resistance. ( $g = 9.81 \text{ m s}^{-2}$ )

- (a) (i) The mass of the volleyball is 0.22 kg. Find the work done on the ball by the player. (2 marks)

.....

.....

.....

.....

- (ii) Determine the speed  $v$  with which the ball hits point C on the ground. (2 marks)

- (b) The length of the court  $AC$  is 18 m and the net is positioned midway between  $A$  and  $C$ . It takes time  $t$  for the ball to reach point  $B$  which is vertically above the net.

(i) State whether the ball is ascending, flying horizontally or descending at  $B$ . (1 mark)

(ii) Find  $t$ . (2 marks)

- (c) Another player suggests that the volleyball can reach point  $C$  in a shorter time if it is served with a similar initial speed but at a smaller angle with the horizontal (e.g.  $13.2 \text{ m s}^{-1}$  at an angle of  $35^\circ$ ). Without doing any calculation, explain whether this suggestion is justified. (2 marks)

- (d) Volleyball players have to jump and land frequently in a game. Referring to principles of mechanics, explain why volleyball courts with wood rather than concrete flooring may help to protect the players from injuries. (2 marks)

table surface

Figure 4.1(a)

A small sphere is projected along the track with speed  $u$  at  $A$ . It moves along the track and passes  $B$  at  $4.0 \text{ m s}^{-1}$ . Neglect air resistance. ( $g = 9.81 \text{ m s}^{-2}$ )

(a) By using the law of conservation of energy, find  $u$ .

2.

**Figure 2.1**

In a road test, John drives his car along a straight horizontal road (see Figure 2.1). The car takes 9.3 s to accelerate from rest to  $100 \text{ km h}^{-1}$ . The total mass of John and his car is 1400 kg.  
(Note:  $100 \text{ km h}^{-1} = 27.8 \text{ m s}^{-1}$ )

- (a) Find the total kinetic energy of John and his car when travelling at  $100 \text{ km h}^{-1}$ . Hence estimate the average output power of the car during this acceleration. (3 marks)

.....

.....

.....

.....

.....

.....

.....

- (b) A similar road test is conducted on an inclined road. The car now takes more than 9.3 s to accelerate from rest to  $100 \text{ km h}^{-1}$  along the road (see Figure 2.2). Assume the output power of the car remains unchanged. Explain why it takes a longer time for the car to accelerate up an inclined road than along a horizontal road. (2 marks)
